

AGENTIC PAYMENTS

# GOOGLE'S PROTOCOL WILL NOT SAY WHO PAYS.

---

SWIPE →

# WHAT AP2 ACTUALLY DOES

---

It signs three mandates. What the buyer asked for, what the agent was authorised to spend, and what the merchant delivered.

# **AS A RECEIPT, IT IS GOOD WORK**

---

If an agent buys the wrong thing, a processor can pull that record and see what each party saw at the moment of purchase.

# WHAT IT DOES NOT DO

---

Settle liability. Everest Group reaches the same conclusion. AP2 supplies the evidence and leaves the loss unassigned.

# WHY CARD DISPUTES WORK

---

Not because the evidence is good. Because somebody wrote down, in advance, who loses when the evidence runs out.

# HONG KONG MOVED ON IT

---

On 27 August the Hong Kong Monetary Authority named 36 agentic AI use cases from nearly 100 proposals, agent identity for payments among them.

# THE REGULATORS' OWN PROBLEM

---

Know-your-customer rules were not designed to verify an agent, or to settle who is ultimately responsible for what it does.

# SO THIS WEEK

---

For every agent I run: which log proves what it was told to do, who holds that log, and how long it lives.

# **THE AGENTS ARE ALREADY SPENDING.**

---

Follow if you build on this.
